Memory Image Module for Linux

You are assigned to create the following project in the C programming language.

The project is about building a module to demonstrate you have enough knowledge about Linux internals, low level programming skills and researcher skills.

We are expecting a module that has to extract memory into a database (such as: mem.image).

- Memory dump must be raw data.
- Module has to support kernel version 2.x-5x.
- Creating a Makefile (or a script) to build and test is a plus.
- Creating a README.md is a plus.
